Sequence 13, Application US/09202904A

Patent No. 6395471

GENERAL INFORMATION:
APPLICANT: Fang, Sung Key
APPLICANT: Hahn, Bumsuk Key
TITLE OF INVENTION: the Activity of Hepatitis C Virus
TITLE OF INVENTION: the Activity of Hepatitis C Virus
TITLE OF INVENTION: Of Gene and a Use Thereof
TITLE OF INVENTION: Of Gene and a Use Thereof
FILE REFERENCE: A32210-PCT-USA 072944.0104
CURRENT APPLICATION NUMBER: US/09/202,904A

CURRENT FILING DATE: 1997.06-25

PRIOR FILING DATE: 1997.06-25

Sequence 5, Application US/08021623C

SENERAL INFORMATION:

APPLICANT: Barnes Ph.D., Wayne M.

TITLE OF INVENTION: Thermostable DNA polymerase with

TITLE OF INVENTION: enhanced thermostability and enhanced length and

TITLE OF INVENTION: efficiency of primer extension

NUMBER OF SEQUENCES: 17

CORRESPONDENCE ADDRESS:

ADDRESSEE: Senninger, Powers, Leavitt and Roedel

STREET: One Metropolitan Square, 16th Floor

CITY: St. Louis

STATE: Missouri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TTCTCAGAATGACTTGGTTGAGTACTCACCAGTCACAGAAAAGCATCTTACGGATGGCAT

The invention describes a targeting vector (positive selection vector)

(I) capable of modifying a target gene. (I) comprises two sequences (S1 and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of that arget gene. Use of (I) for enriching cells comprising disruption or modification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination into the genemes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising call with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides a increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of
     Novel targeting vector modifying target gene, has first and second sequences homologous to target gene portions, a selectable marker cassette and regulator, useful for producing animals with targeted gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transgenic animal; targeting vector; positive selection vector;

                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nuclectide construct for generating DNA constructs. The nucleotide construct comprises a sequence encoding a positive selection marker flanked by restriction enzyme sites, where restriction site is flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct can be treated so that single-stranded regions are created at each sequence lacking at least one nucleotide. The nucleotide construct is useful in a rapid and efficient method for generating DNA constructs suitable for introduction into embryonic stem sequence is plasmid pGG2 vector construct containing an ampicillin resistance gene and neomycin gene (Neo'). On each site of the Neo' gene are two sites for ligation independent cloning along with restriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TTTCTAAATACCTTCAAATATGTATCCGCTCATGAGACAATAACCCTGATAAATGCTTCA 120

```

```
The invention relates to a targeting construct comprising two sequences homologous to a target gene, and a selectable marker, is new. The target gene is a retina-specific nuclear receptor gene, a lymphoid-specific GPCR (G protein coupled receptor) gene, a melanocyte stimulating hormone coeptor gene, a magnesium-dependent protein phosphatase gene, chemokine receptor like protein gene, a cGMP phosphodiseterase gene, chemokine receptor like protein gene, where the mouse exhibits an eye abnormality, callular infiltration, hyposocitive behaviour. Hung abnormality, elevated white blood cell count, abnormality in the aorta, kidney, liver, lymph codes, skin or salivary gland, increased body and organ weight, or elevated levels of ALT (not defined), phosphorus, potassium, or clavated levels of ALT (not defined), phosphorus, potassium, or elevated levels of ALT (not defined), increased activity or decreased antiety behaviour. The construct is used for introducing targeted antiety behaviour. The construct is used for introducing targeted antiety behaviour. The construct is used for introducing targeted histological or behavioural phenotypes relating to a disruption in a target gene (e.g. tumours, cancer, retinal degeneration and retinitis construct gene (e.g. tumours, cancer, retinal degeneration and retinitis and in sarcening diseases. The present sequence is the vector of puggenorating or treating diseases. The present sequence is the vector of puggenorating or treating diseases. The present sequence is the vector of puggenorating or tradeting diseases. The present construct of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          360

The present sequence represents vector pDG2. This vector contains an amposition resistance gene and a neomycin gene. The vector is used in the invention. The specification describes a non-human transgenic animal comprising a disruption in the matrix metalloproteinase (MMP)-23 gene. Transgenic animals of the invention comprising a homozygous or heterozygous disruption in MMP23 gene are useful for identifying agents which modulate MMP23 expression or function. They are also useful for identifying agents that are capable of ameliorating a phenotype of a transgenic animal comprising a disruption in an MMP-23 gene or ameliorating a disease associated with the phenotype of a transgenic animal model for disease, disorders and conditions characterized by a disruption in a gene encoding a metalloproteinase, more particularly disease, disorders and conditions associated with the phenotypes test substrates for identification of drugs, pharmaceuticals and therapies effective in treating diseases, disorders and conditions test substrates for identification of drugs, pharmaceuticals and therapies effective in treating diseases, disorders and conditions as sociated with disturbtion in the target gene. The animal is useful for testing and developing new treatments relating to behavioural phenotypes demonstrated by the animal models

Novel nucleotide construct useful for disrupting function of gene in embryonic stem cell, comprises sequence encoding positive selection marker flanked by restriction enzyme sites, to create a single-stranded region.

Claim 10; Fig 2A; 37pp; English.

The present invention relates to a new nucleotide construct comprising a sequence encoding positive selection marker flanked by restriction enzyme sites are flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct is treated so that the invention is useful for disrupting the function of a function. The invention is useful for disrupting the function of a carget sequence or gene in a cell e.g. embryonic stem cell, by inserting sequences homologous to the target gene into the construct such that the sequences homologous to the target gene flank the positive selection marker, to produce a targeting construct, and introducing the targeting construct into the cell to produce a homologous recombinant and thus the function of the target gene or sequences is disrupted. The homologous construct into the cell to produce a homologous recombinant and thus the tention of the target gene or sequence is disrupted. The homologous sequences are sequences flanking the site in the target gene that is to be disrupted. The invention eliminates the need for the traditional the clone and multiple cloning steps. The method of the invention is fast and efficiently generates nucleotide construct, and reduces the time construct making a knock-out vector. Isolating an individual genomic clone or mapping the restriction siles within the clone is not needed for invention is not needed for the method. The method is ligation independent cloning. The present invention is construct the processor the processor the invention independent cloning. The present invention is sequence of the invention independent cloning.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence for plasmid vector pDG2 is used as a construct for genes encoding trinucleotide repeat proteins (TRP) such as gene T243 to produce disruption in the DNA. The invention describes methods of producing embryonic stem (ES) cells comprising a hererozygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene encoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a Knockout mouse. Also described are methods of determining whether expansion of the trinuclectide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in transleting trinucleotide repeat disorders e.g. fragils K syndrome and Huntington's disease. The animal models for trinucleotide repeat

disorders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both

transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heerologous mucleic acid that encodes a therapeutic product which is useful for making a library of Accs comprising random portions of a genome. ACC44612 to ACC44732 and ABB96650 to ABB96657 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of chromosome. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a cartier system microhinection, insect, reptile, amphibian, arachind, or mammal) by introducing (II) by cell fusion lipid-mediated transfection. By a carrier system microhinection, microcal fusion, electroporation, micropolectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous making a library of ACes comprising random portions of a genome. ACC44612 cexemplification of the present invention

comprising from the amino terminal, at runcated diphtheria toxin molety, a connector, and one single chain Fv of the variable region of a UGHT1 antibody. The single chain Fv comprises VL, L, or VH, L is a Gly-Ser linker, and VL and VH are the variable light and heavy domains of the anti-CD3 antibody THE single chain Fv comprises VL, L, or VH, L is a Gly-Ser linker, and VL and VH are the variable light and heavy domains of the anti-CD3 antibody UGHT1. Also included are a nucleic acid encoding the novel immunocoxin fusion protein, a vector comprising the nucleic acid cond a cell comprising the nucleic acid. The immunotoxin may also be a pseudomonas endotoxin A (ETA). The immunotoxin fusion be a geudomonas endotoxin A (ETA). The immunotoxin fusion proteins may be used in vivo to systemically reduce populations of T cells, or exvivo to effect T-cell depletion from a treated cell population. The cuison proteins can be administered to a subject who is or will be a recipient of an allotransplant to prevent or reduce T-cell mediated acute or chronic transplant rejection of the transplant endiated acute dissues such as systemic lupus exthematosus, type I diabetes, the unmunotal arthritis, myasthenia gravis, multiple solerosis, infectious diseases such as system (e.g. ADES (acquired immunodeficiency syndrome)) and chronic immunosuppression. The present sequence is a planning, pCES, used as an intermediate cloning vector to construct the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3357

cloning sites of the vector Litmus p29. The vector is only 3.4 kb in size and can transform both E. coli and Corynebacterium ulcerans and, thus, can be used to produce toxins and mutant toxins. In addition, the invention provides a mutant Pichia pastoris, a method for producing this mutant and a method of expressing engineered toxin mutants and toxin fusion proteins in the mutant PP pastoris. The invention further provides a mutant GHO cell, a method for producing these a mutant GHO cell, a mutant insect cell, a method for producing these mutants and a method of expressing engineered toxin mutants and toxin fusion proteins in the mutant cells. Methods are claimed for expressing adiphiberia toxin or a Pseudomonas exotoxin A toxin in the mutant cells. The invention results in higher fusion protein secretion than prior art methods, thus eliminating the need for refolding, and providing glycosylated immunotoxins that are useful for in vivo clinical application. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pCE96; ds; immunotoxin; pseudomonas exotoxin A; ETA; diphtheria toxin; DT; cytostatic; immunosuppressive; immunostimulant; antidiabetic; antiarthritic; anti-HTV; anti-inflammatory; anti-Trheumatic; actil immunotoxin fusion protein; antibody; UCHH1; FV; CD3; T cell leukaemia; lymphoma; graft-versus-host disease;

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial dromosomes. The isolated plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antiense RNA, trNA, rDNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapoutic proteins, and conting proteins, antipordies, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The cherologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The here chromosome (BAC) or a yeast artificial chromosome (YAC). This polynucleotide sequence represents the DNA of a plasmid used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ririgeegearrirectrecretririrecreaceasaacecreargaaaga 480

                       The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologus to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome, (I) can be used in gene therapy. (M.) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a riticial chromosome, preferably an ACes. (II) is useful for producing a ratificial chromosome, preferably an ACes. (II) is useful for producing a mammal) by introducing (II) by cell fusion, lipid-mediated transfection, by a carrier system, microinjection, microcall fusion, electroporation, cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for conclinity a library of ACes comprising random portions of a genome. The specification describes a method of determining the quantity of a target RNA in a tissue sample. The method comprises reverse transcribing target RNA from the tissue and then amplifying the cONA, binding a labelled sequence corresponding to an internal sequence complementary to one of the strands of the target RNA product, and determining the amount of labelled RNA bound to the amplified target DNA. The method is used to quantify more accurately the amount of target RNA in a sample

chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform attification decomesome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection microprojectile system, microinjection, microcal fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 to ACG44732 and ABD96650 to ABD96657 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            360

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits siteed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform criticial chromosome, preferably an Aces. (II) is useful for introducing an heterologous nucleic acid molecule into a platform criticial chromosome, preferably an Aces. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of Aces comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the

Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of

Also described. (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fleming
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Leung J,
